

Prerequisites:

1. Complete IBM Cloud prerequisites:

<https://github.com/SuperhackMelbourne/superhack2017/blob/master/bluemix/README.md>

Steps:

1. Open your Bluemix dashboard (<https://console.bluemix.net/dashboard>)

2. Click on the service with the “Internet of Things Platform” service offering

Cloud Foundry Services 2/100 Used		
Name ^	Service Offering	Plan
superhack-ay1-cloudantNoSQLDB	Cloudant NoSQL DB	Lite
superhack-ay1-iotf-service	Internet of Things Platf...	Lite

3. Click “Launch” on the next page

Let's get started with Watson IoT Platform

Securely connect, control, and manage devices. Quickly build IoT applications that analyze data from the physical world.

Launch

Docs

4. Click on “Devices” in the left sidebar

5. Click on the “Device Types” tab

Device Types

6. Click on “+ Add Device Type” near the top right

+ Add Device Type

7. Select “Gateway” for the type, enter ESP32 for the name and click “Next”

Add Type

Identity

Device Information

×

Select Type

Device types group devices that have similar characteristics, such as model number, firmware version, or location. Give the device type a unique name and a description that identifies characteristics that are shared by devices of this type.

Type

Device

Or

Gateway

Name

ESP32

The device type name is used to identify the device type uniquely and uses a restricted set of characters to make it suitable for API use.

12. Enter a token (don't lose this!) between 8 and 36 characters and click "Next"

Add DeviceIdentityDevice InformationSecuritySummary

Device Security

There are two options for selecting a device authentication token.

Auto-generated authentication token (default)

Allow the service to generate an authentication token for you. Tokens are 18 characters and contain a mix of alphanumeric characters and symbols. The token is returned to you at the end of the device registration process.

Self-provided authentication token

Provide your own authentication token for this device. The token must be between 8 and 36 characters and contain a mix lowercase and uppercase letters, numbers, and symbols, which can include hyphens, underscores, and periods. Do not use repeated characters, dictionary words, user names, or other predefined sequences.

Authentication Token

myhexboardtoken

Make a note of the generated token. Lost authentication tokens cannot be recovered. Tokens are encrypted before being stored.

Authentication token are encrypted before we store them.

<

Next

13. Click "Done"

14. Take note of your device credentials

Device Credentials

You registered your device to the organization. Add these credentials to the device to connect it to the platform. After the device is connected, you can navigate to view connection and event details.

Organization ID	y1ij2
Device Type	ESP32
Device ID	hex-board
Authentication Method	use-token-auth
Authentication Token	myhexboardtoken

!

Authentication tokens are non-recoverable. If you misplace this token, you will need to re-register the device to generate a new authentication token.

14.1 Click on Security on the left. Add a new custom rule. Set the scope to ESP32 and security level to TLS optional. Click "Refresh compliance" and then save

Back
Cancel
Save

Connection Security

Use the Connection Security policy to set the default security level that is applied to all devices. You can then add custom rules for specific devices. When the default rule and custom rules are defined, you can view the compliance levels for your organization.

1 Device in organization
Refresh compliance
Updated 24 November 2017 21:59

Default Rule

Define the default connection security level to use for all device types that do not have custom rules defined. You can view the number of devices that are affected and then predicted level of compliance.

Note: The device number and predicted compliance values are estimates based on a report that runs at varying intervals.

Scope	Security Level	Predicted Compliance ⓘ	# of Devices
Default	TLS with Token Authentication ▼	<div></div> 0 Pass 0 Fail 0 Unknown	0 devices

Custom Rules

You can define custom connection rules for specific device types. Custom rules overwrite the default rule for the specified device types. The predicted compliance value is updated to reflect the default settings and the custom settings.

Add Custom Rule ⓘ No available device types

<input type="checkbox"/>	Scope ⌵	Security Level ⌵	Predicted Compliance ⓘ ⌵	# of Devices ⌵	
<input type="checkbox"/>	ESP32	TLS Optional ▼	<div></div> 1 Pass 0 Fail 0 Unknown	1	

15. Download and install Mongoose OS from <https://mongoose-os.com/software.html>

16. Download and install CP210x USB to UART Bridge VCP Drivers from <https://www.silabs.com/products/development-tools/software/usb-to-uart-bridge-vcp-drivers>

17. Connect battery to hex board

18. Connect hex board to your computer using supplied USB cable

19. Run Mongoose OS, select COM3 in the drop-down and click "Select". You should see Flash and Set WiFi automatically done.

```

1 load('api_mqtt.js');
2 load('api_gpio.js');
3
4 let pin = 32, topic = 'iot-2/type/ESP32/id/hex-board/cmd/update/fmt/json';
5
6 GPIO.set_button_handler(pin, GPIO.PULL_UP, GPIO.INT_EDGE_POS, 200, function() {
7   MQTT.pub('iot-2/type/ESP32/id/hex-board/evt/event/fmt/json', JSON.stringify({ message: "I need he
8 }, null);
9
10 MQTT.sub('iot-2/type/ESP32/id/hex-board/cmd/update/fmt/json', function(conn, topic, msg) {
11   print('Topic:', topic, 'message:', msg);
12 }, null);
13

```

Code:

```
load('api_mqtt.js');
```

```
load('api_gpio.js');
```

```
let pin = 32, topic = 'iot-2/type/ESP32/id/hex-board/cmd/update/fmt/json';
```

```
GPIO.set_button_handler(pin, GPIO.PULL_UP, GPIO.INT_EDGE_POS, 200, function() {
```

```
  MQTT.pub('iot-2/type/ESP32/id/hex-board/evt/event/fmt/json', JSON.stringify({ message: "I need help!"}));
```

```
}, null);
```

```
MQTT.sub('iot-2/type/ESP32/id/hex-board/cmd/update/fmt/json', function(conn, topic, msg) {

    print('Topic:', topic, 'message:', msg);

}, null);
```

21. Click on “Device Config” on the left and set the MQTT server to xxxxxx.messaging.internetofthings.ibmcloud.com:1883, where xxxxxx is your Organization ID from Step 14. Ensure User is use-token-auth and set the password to your token from Step 12. Click “Save configuration”

The screenshot shows the 'Device Configuration' window. On the left is a sidebar with icons for Projects, Device Files, Device Config (highlighted), Device Service, Terminal, and Forum. The main area has a title bar 'Device Configuration' and two tabs: 'Simple View' (selected) and 'Expert View'. Below the tabs are two sections: 'Debug Settings' and 'MQTT Settings'. In 'Debug Settings', 'Hexdump traffic:' has an unchecked checkbox, and 'Log level:' is set to '2'. In 'MQTT Settings', 'Enable MQTT' has a checked checkbox. Below this are four input fields: 'MQTT server' with the value 'y1ij2.messaging.internetofthings.ibmcloud.cc', 'User' with 'use-token-auth', and 'Password' with 'myhexboardtoken'.

22. Click on “Expert View” and at line 63, change client ID to g:xxxxxx:ESP32:yyyyyy where xxxxxx is your Organization ID from Step 14 and yyyyyy is your device ID from Step 10. Click “Save configuration”
